Re: "Clean Fill" Testing of Soil Sample-TAL/TCL Test
Soil sample marked as # ANS-5326-S1
Bergen Community College

Dear Mr. Rutishauser,

Enclosed, please find a laboratory test report for one composite soil sample prepared from 5-point grab samples on September 27, 2019 for the project referenced above. The primary purpose of the sampling and analytical work was to determine the presence of any hazardous contaminants in the soil.

Sample was analyzed for Target Compound List (TCL), Target Analyte List (TAL), Total Petroleum Hydrocarbon (TPHC- by EPH Method), pH, Chromium Hexavalent & Chromium Trivalent. Test results were reviewed against N.J. D.E.P. Residential, Non-Residential Direct Contact Soil Remediation Standard and Impact to Groundwater soil screening level criteria effective from September 18, 2017.

Contamination was not encountered exceeding NJDEP Residential and Non-Residential Standards in this sample.

However, Aluminum, Manganese and Mercury exceeded Impact to Groundwater soil screening level criteria; but the Groundwater Quality Standards (GWQS) for Aluminum and Manganese are secondary, that is they are not based on health considerations. Additionally, these elements may be found as background contaminants. Therefore, Department does not require to address IGW pathway for these contaminants unless there is cause to believe that their presence is due to a site discharge.

Should you have any question or require additional information, please do not hesitate to contact the undersigned at (908) 754 - 8383.

Sincerely,

Re: "Clean Fill" Testing of Soil Sample-TAL/TCL Test
Soil sample marked as # ANS-5727-S1
533 Wyndmere Avenue
Ridgewood, NJ 07450

Dear Mr. Rick,

Enclosed, please find a laboratory test report for one soil sample collected on May 10, 2021 for the project referenced above. Sample ANS-5727-S1 is collected from 8' depth from the testpit. The primary purpose of the sampling and analytical work was to determine the presence of any hazardous contaminants in the soil.

Sample was analyzed for Target Compound List (TCL), Target Analyte List (TAL), Total Petroleum Hydrocarbon (TPHC- by EPH Method), pH, Chromium Hexavalent and Chromium Trivalent. Test results were reviewed against N.J. D.E.P. Residential, Non-Residential Direct Contact Soil Remediation Standard and Impact to Groundwater soil screening level criteria effective from September 18, 2017.

EPH concentration of 117 ppm was noted in this sample. (EPH concentration below fractionation trigger of 1700 ppm).

Contamination was not encountered exceeding NJDEP Residential and Non-Residential Standards in this sample.

However, **Aluminum** and **Manganese** exceeded Impact to Groundwater soil screening level criteria; but the Groundwater Quality Standards (GWQS) for **Aluminum** and **Manganese** are secondary, that is they are not based on health considerations. Additionally, these elements may be found as background contaminants. Therefore, Department does not require to address IGW pathway for these contaminants unless there is cause to believe that their presence is due to a site discharge.

Should you have any question or require additional information, please do not hesitate to contact the undersigned at (908) 754 - 8383.

Sincerely,

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below. Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are not included in this data set

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

SW-846 8260B, GC/MS Volatiles

Batch #: B163421AA (Sample number(s): 8721669 UNSPK: P719335)

Site Remediation Program

Soil Cleanup Criteria (mg/kg)

Table Last Revised: 12 May 1999 to correct the impact to ground water criterion for bis(2-chloroethyl) ether. Please note that this table is for reference purpose and cases with Remedial Action Workplans approved prior to the May 7, 2012 amendments of the Remediation Standards at N.J.A.C. 7:26D.

This listing represents the combination of Tables 3-2 and 7-1 from the Department of Environmental Protection and Energy's February 3, 1992 proposed rule entitled Cleanup Standards for Contaminated Sites, N.J.A.C. 7:26D, as corrected based upon errors identified by the Department during or subsequent to the comment period as well as new toxicological or other information obtained since the rule proposal. Please refer to the respective footnotes for more detail. Notwithstanding, where the following criteria are based on human health impacts, the Department shall still consider environmental impacts when establishing site specific cleanup criteria. This along with other site-specific factors including background conditions may result in site specific cleanup criteria which differ from the criteria listed below. Therefore, this list shall not be assumed to represent approval by the Department of any remedial action or to represent the Department's opinion that a site requires remediation.

Footnotes:

(a) Criteria are health based using an incidental ingestion exposure pathway except where noted below.

(b) Criteria are subject to change based on site specific factors (e.g., aquifer classification, soil type, natural background, environmental impacts, etc.).

(c) Health based criterion exceeds the 10,000 mg/kg maximum for total organic contaminants.

(d) Health based criterion exceeds the 1000 mg/kg maximum for total volatile organic contaminants.

(e) Cleanup standard proposal was based on natural background.

(f) Health based criterion is lower than analytical limits; cleanup criterion based on practical quantitation level.

(g) Criterion based on the inhalation exposure pathway.

(h) The impact to ground water values for inorganic constituents will be developed based upon site specific chemical and physical parameters.

(i) Site specific determination required for SCC for the allergic contact dermatitis exposure pathway.

(j) Contaminant not regulated for this exposure pathway.

(k) Criteria based on inhalation exposure pathway, which yielded a more stringent criterion than the incidental ingestion exposure pathway.

(l) No criterion derived for this contaminant.

(m) Criterion based on ecological (phytotoxicity) effects.

(n) Level of the human health based criterion is such that evaluation for potential environmental impacts on a site by site basis is recommended.

(o) Level of the criterion is such that evaluation for potential acute exposure hazard is recommended.

(p)

6-1739018

Criterion based on the USEPA Integrated Exposure Uptake Biokinetic (IEUBK) model utilizing the default parameters. The concentration is considered to protect 95% of target population (children) at a blood lead level of 10 ug/dl.

(q) Criteria were derived from a model developed by the Society for Environmental Geochemistry and Health (SEGH) and were designed to be protective for adults in the workplace.

(r) Insufficient information available to calculate impact to ground water criteria.

(s) Criterion based on new drinking water standard.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	none detected
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

<	less than
>	greater than
ppm	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.
ppb	parts per billion
Dry weight basis	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Laboratory Data Qualifiers:

C - Result confirmed by reanalysis
E - Concentration exceeds the calibration range
J (or G, I, X) - estimated value ≥ the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P - Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U - Analyte was not detected at the value indicated
V - Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference...
W - The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as "analyze immediately" are not performed within 15 minutes.

COMMENTS: Performance was acceptable, with the following exceptions and/or notes.

1) The soil samples were extracted on May 9, 2024 within the required 14-day holding time. SVOC analyses were performed by May 13, 2024 within the 40 day holding time after extraction. Extraction and analysis holding times were met.

2) Samples SB-3 and SB-11 were diluted by a factor two times for all SVOCs. Sample SB-5 was diluted by a factor of five times for fluoranthene and pyrene only. Samples DUPE-1 was diluted by a factor of five times for fluoranthene only. No other sample dilutions were required for analysis of SVOCs. Several SVOCs were detected in soil samples at concentrations between the method detection limit (MDL) and the reporting limit. **Due to limited accuracy in this portion of the calibration range these SVOCs results are qualified as J/Estimated, as noted in the following pages:**

3) SGS provided results from one full suite solid matrix method blank in support of the SVOC analyses. No SVOCs were detected in the method blank, with one exception. Carbazole was detected in the method blank at an estimated concentration of 6.2 ug/Kg. Carbazole was detected in several soil samples at concentrations within five times the concentration detected in the method blank. Due to potential blank contamination bias, the following Carbazole results (detections less than 31 ug/Kg) are qualified as U/Non-detect at the concentrations reported, as follows:

Sample ID	Qualified Results (ug/kg)
SB-1	Carbazole = 30.5 ***U***
SB-2	Carbazole = 24.6 ***U***
SB-10	Carbazole = 7.2 ***U***
SB-11	Carbazole = 12.2 ***U***
SB-13	Carbazole = 6.5 ***U***

Results from one aqueous field blank were provided. No SVOCs were detected in the field blank.

4-5) SGS provided results from one full set of solid matrix laboratory control sample (LCS) analyses (identified as blank spike analyses) in support of the SVOC analyses. All LCS recoveries were within laboratory specified control limits, ranging from 40 to 120 percent. Accuracy, as demonstrated by these analyses is acceptable.

One set of aqueous LCS and LCS duplicate analyses were provided in support of the field blank. LCS recoveries were low for several SVOCs. No action is taken based on the low LCS recoveries in support of the field blank.

6-7) SGS provided results from one set of project specific (spike on sample SB-1) matrix spike (MS) and MSD duplicate analyses in support of the SVOC analyses. MS and MSD recoveries ranged from 12 to 110 percent (various control limits). The maximum RPD between MS and MSD results was 55 percent. Precision and accuracy, as demonstrated by these analyses is acceptable.

8) Six surrogates were spiked into each soil sample in support of the SVOC analyses. Surrogate recoveries were acceptable, ranging from 61 to 103 percent (various control limits). Accuracy, as demonstrated by these analyses is acceptable.

9) Two sets of field duplicate samples were submitted in support of the SVOC analyses.

DUPE-1 was submitted as a blind field duplicate of primary sample SB-7.
Sample DUPE-2 was submitted as a blind field duplicate of primary sample SB-11.

Results of the field duplicate sampling for SVOCs that were detected in either of the primary or duplicate samples are presented below. Precision assessment is based on the RPD % between sample results. A 50 % RPD or less is used to define acceptable precision between the soil sample results. **Bold RPD values exceed this criterion. In such cases the primary and duplicate sample results are qualified as estimated.**

* Sample SB-11 was analyzed at a 2 times dilution so reporting limits are two times higher than for duplicate sample DUP 2. The value of the detection limit was used in the RPD calculation for SB-11 when the concentration was non-detect (U).

+/- RL = Results agree within a reporting limit increment and precision is determined to be acceptable.

10) No anomalies were noted with respect to results SVOC quantitation or reporting. The laboratory noted that CCV recoveries were high or some SVOCs that were not detected in the associated samples. No bias to the sample results is indicated by the high CCVs. Numerous Tentatively Identified Compounds (TICs) were reported with each sample analyzed for SVOCs. Results for TICs are considered to be estimated in magnitude. In some cases, the identification of the TIC was verified against the library of SVOCs compounds associated with the method.

COMMENTS: Performance was acceptable, with the following exceptions and/or notes.

1) The soil samples for analysis of pesticides were extracted on May 8, 2024 within the required 14-day holding time. Pesticide analyses were performed by May 10, 2024 within the 40-day holding time after extraction.

2) Sample SB-5 was analyzed at a 5 times dilution, though no pesticides were detected at concentrations greater than reporting limits. No explanation was provided for the dilution, and reporting limits were raised accordingly. Several pesticides were detected in soil samples at concentrations between the method detection limit (MDL) and the reporting limit. **Due to limited accuracy in this portion of the calibration range these pesticide results are qualified as J/Estimated, as follows:**

3) SGS provided results from one full suite solid matrix method blank in support of the pesticide analyses. Three pesticides were detected in the method blank at estimated concentrations, as follows:

Sample ID	Qualified Results (ug/kg)
Method Blank	beta-BHC = 0.088 *J*
Method Blank	Delta-BHC = 0.11 *J*
Method Blank	Endosulfan sulfate = 0.080 ***J***

Of these three, only beta-BHC was detected in any associated soil samples at concentration within 5 times that of the method blanks. **Due to potential blank contamination bias, the following beta-BHC detections in soil samples are qualified ad U/Non-detect at the concentrations reported.**

SB-2	beta-BHC = 0.13 ***U***
SB-4	beta-BHC = 0.14 ***U***
SB-6	beta-BHC = 0.15 ***U***
SB-8	beta-BHC = 0.13 ***U***

SB-14	beta-BHC = 0.09 ***U***
DUPE 1	beta-BHC = 0.13 ***U***

One aqueous field blank was analyzed with the soil samples. 4,4-DDT was detected in the field blank at a concentration of 0.020 ug/L. The field blank was re-analyzed out of aqueous holding time and 4,4-DDT was detected at an estimated concentration of 0.0048 ug/L. SGS attributed these detections to lab contamination, as 4,4-DDT was also detected in the aqueous method blanks at similar concentrations. Because 4,4-DDT was not detected in the solid matrix method blank, no action is taken.

4-5) SGS provided results from one full set of solid matrix laboratory control sample (LCS) analyses (identified as blank spike analyses) in support of the pesticide analyses. All LCS recoveries were within laboratory specified control limits, ranging from 70 to 94 percent. Accuracy, as demonstrated by these analyses is acceptable. Some spike recoveries were reported from the 2nd analytical signal, as precision for the primary signal was poor.

LCS and LCS duplicate results were provided in support of the aqueous analyses (field blank) with acceptable precision and accuracy. Precision between LCS and LCSD analyses in support of the field blank re-analyses was poor for nearly all pesticides. This does not impact the soil sample results.

6-7) SGS provided results from one set of batch specific matrix spike (MS) and MSD duplicate analyses in support of the pesticide analyses. MS and MSD recoveries were within prescribed control limits for all target pesticides ranging from 40 to 115 percent. Precision between MS and MSD recoveries was acceptable, with a maximum RPD between MS and MSD results of 13 percent.

8) Two surrogates (tetrachloro-m-xylene and decachlorobiphenyl) were spiked into each soil sample in support of the solid matrix pesticide analyses. Surrogates were reported from each of the two columns used in the analyses. Surrogate recoveries were in control limits ranging from 44 to 127 % percent (control limits for tcmx are = 46-145% and are 29-163% for dcbp)

9) Several sets of DDT/Endrin breakdown check standards were analyzed coinciding with each analytical batch. DDT and Endrin breakdown levels were all less than the QAPP specific level of 15 percent.

10) Sample DUPE-1 was submitted as a blind field duplicate of primary sample SB-7.
Sample DUPE-2 was submitted as a blind field duplicate of primary sample SB-11.

Results of the field duplicate sampling for pesticides that were detected in either of the primary or duplicate samples are presented below. Precision assessment is based on the RPD % between sample results. A 50 % RPD or less is used to define acceptable precision between the soil sample results. **Bold RPD values exceed this criterion. In such cases the primary and duplicate sample results are qualified as estimated.**

NC – Not calculated. Both results were qualified due to associated method blank contamination.

The value of the detection limit was used in the RPD calculation for samples when the primary or duplicate concentration was non-detect (U).

+/- RL = Results agree within a reporting limit increment and precision is determined to be acceptable.

11) No anomalies were noted with respect to results pesticide quantitation or reporting, with the following exceptions. Numerous pesticides were flagged by SGS due to an RPD of more than 40% between the dual GC columns used for quantitation and confirmation. This criterion is not addressed in the project QAPP. In almost all cases, the pesticides in question were already qualified as J/Estimated due to reporting limits and no further action is required.

RIDGEWOOD BERM SOIL SAMPLING – LEACHATE RESULTS

VALIDATION OF LABORATORY RESULTS
SGS LABORATORY (DAYTON, NJ)

LABORATORY REPORT # JD87833R DATED JUNE 10, 2024

INTRODUCTION

Matrix New World Engineering (Matrix) collected several soil samples and associated field duplicates on May 3, 2024. Samples were relinquished to an SGS Laboratory (SGS) courier, and then transported to SGS Laboratory, located in Dayton, New Jersey on the day of sampling. After initial analyses, subsequent Synthetic Precipitation Leaching Procedure (SPLP) analyses were further requested for selected samples. The validation of these SPLP analyses is described in this report.

Sample identifications and requested analyses are listed below.

Matrix Sample IDs	Laboratory Sample IDs	Analyses Requested	Analytical Methods
SB-1 SB-9	JD87833-1R JD87833-9R	SPLP Lead and SPLP Mercury	SPLP SW846 1312 leaching followed by Method 6010D analysis for lead and 7470A analysis for mercury
SB-11	JD87833-11R	SPLP Lead	SPLP SW846 1312 leaching followed by Method 6010D analysis for lead
SB-4 SB-5 SB-6	JD87833-4R JD87833-5R JD87833-6R	SPLP SVOCs Benzo(a)anthracene only	SPLP SW846 1312 for leaching followed by Method 8270E SIM
SB-14	JD87833-14R	SPLP Mercury	SPLP SW846 1312 leaching followed by Method 7470A analysis for mercury

SPLP = Synthetic Precipitation Leaching Procedure
SVOCs – Semi volatile Organic Compounds
SIM – Selected ion monitoring

Samples were received under proper chain of custody in two coolers and were properly chilled at 2.1 to 2.2 degrees Celsius

Quality Control for the soil samples and SPLP extracts is evaluated in the following checklist tables and comments. A summary of data quality for the samples analyzed is provided at the end of this validation report.

COMMENTS: Performance was acceptable, with the following exceptions and/or notes.

1) Extractions for SPLP SVOC analyses were performed on May 27, 2024 and on May 31, 2024. The extraction holding time is 14 days from date of field collection. Therefore, all extraction times are exceeded by at least 10 days, and may compromise the sample results. SVOC analyses were performed by June 1, 2024, within the 40 day holding time after extraction. Analysis holding times were met.

2) No sample dilutions were required for analysis of SPLP SVOCs. All reporting limits are acceptable, with the following considerations. **Benzo(a)anthracene was reported at concentrations between the method detection limit (MDL) and the reporting limit in two soil sample. SGS laboratory flagged these samples with a J" qualifier. Due to limited accuracy in this portion of the calibration range, these SVOC result are qualified as J/Estimated (pending the results of the blank evaluation), as follows:**

Sample ID	**Qualified Result (ug/L)**
SB-4	Benzo(a)anthracene = 0.0785 ***J***
SB-5	Benzo(a)anthracene = 0.0483 ***J***

3) SGS provided results from two method blanks in support of the SPLP extract analyses for Benzo(a)anthracene. Results from two additional leachate blanks were also provided. No Benzo(a)anthracene was detected in any of the blanks. **Surrogate recoveries were low in some method blanks, demonstrating potential low bias for the method.**

4-5) SGS provided results from two sets of leachate matrix laboratory control sample (LCS) analyses (identified as blank spike analyses) in support of the Benzo(a)anthracene analyses. LCS recoveries were low at 23 to 29 percent (lower control limit of 33 percent). One LCS recovery was acceptable, resulting in poor precision between LCS and LCS duplicate results. **Precision and accuracy, as demonstrated by these analyses are not acceptable.**

6-7) SGS did not provide results from matrix spike (MS) or MSD duplicate analyses in support of the SVOC analyses.

8) Three surrogates were spiked into each soil sample in support of the SVOC leachate analyses. Surrogate recoveries were acceptable from run #1 analyses, ranging from 37 to 107 percent (various control limits). For run #2 of sample SB-4, two surrogate recoveries were low at 11 and 16 percent (lower control limit of 18 percent). Run #2 was a confirmation run due to low LCS and LSCD recoveries.

9) Field duplicate samples were not submitted in support of the leachate analyses.

10) No anomalies were noted with respect to results SVOC quantitation or reporting, other than instances of low bias noted and the missed extraction holding times.

5) Results from ICP interference check samples were provided in support of lead. ICP interference check sample recoveries were acceptable, within control limits of 80-20 percent.

6-7) SGS provided results from project specific (spikes on samples SB-1 and SB-14) matrix spike (MS) and MSD duplicate analyses in support of the lead and mercury analyses. MS and MSD recoveries were acceptable.

8) SGS provided results from aqueous matrix LCS analyses in support of the lead and mercury analyses. The LCS recoveries were acceptable (control limits of 80-120 percent).

SGS provided one set of TCLP LCS results. LCS recoveries were acceptable.

9) SGS provided results from one set of serial dilution analyses performed on project sample SB-1 in support of lead. Percent differences between the initial result and the 5 times serial dilution result were less the control limit of 10 percent for all metals results where the initial result was greater than 50 times the instrument detection limit,

VALIDATION OF LABORATORY RESULTS
SGS LABORATORY (DAYTON, NJ)

LABORATORY REPORT # JD87833R DATED JUNE 10, 2024

Matrix New World Engineering (Matrix) collected several soil samples and associated field duplicates on May 3, 2024. The validation of these SPLP analyses is described in this report. The sample results have been validated in accordance with the Project QAPP requirements, and professional judgment of the data reviewer.

The QC information evaluated has been described in the preceding pages. Based on this review, data provided for the soil samples collected are determined to be quantitative, with the exceptions noted in the following table.

Validation Summary

Sample Identification(s) / Analyte(s)	Data Qualifier(s)	Reason(s) For Qualification
SB-4 and SB-5 / Benzo(a)anthracene	J/Estimated	Benzo(a)anthracene was reported at concentrations between the method detection limit and the reporting limit. Accuracy in this portion of the calibration curve may be limited.
SB-4, SB-5 and SB-6 / Benzo(a)anthracene	J/Estimated	Potential low bias demonstrated by missed extraction holding timers, low LCS recoveries, and low surrogate recoveries. Identification of benzo(a)anthracene may be accurate, but the magnitude of the sample results is not determined to be reliable.

- Sample(s) JD87716-2DUP were used as the QC samples for the Solids, Percent analysis.

SGS certifies that data reported for samples received, listed on the associated custody chain or analytical task order, were produced to specifications meeting SGS's Quality System precision, accuracy and completeness objectives except as noted.

Estimated non-standard method measurement uncertainty data is available on request, based on quality control bias and implicit for standard methods. Acceptable uncertainty requires tested parameter quality control data to meet method criteria.

SGS is not responsible for data quality assumptions if partial reports are used and recommends that this report be used in its entirety. This report is authorized by SGS indicated via signature on the report cover.
